

Assignment 2

Based on the business model you created in the first assignment, the goal of this assignment is to provide a technical description of how your web application delivers value to your customers as well as its design in form of a customer journey including personas, mockups, and a data model.

1. Description of the Assignment

In this assignment, you will have to provide a technical description of how your web application delivers value to your customers. Think of an example **customer journey** from beginning to end of a customer using your web application for its **main purpose**. Create a demo script of how one or multiple personas use your web application throughout the customer journey and provide accompanying mockups of the UI. The **customer journey** should focus especially on the essential elements specific to your business idea. For example, if you develop an online shopping platform for books, creating store entries as the seller, searching for books as the buyer, adding a book to the shopping cart, and completing checkout are essential elements.

The goal of this description is to make clear how your web application provides the services to the customers as described in the Value Proposition Canvas (VPC) and Business Model Canvas (BMC). Since over the course of the semester you will have to implement a web application, which supports this customer journey, make sure that it's of reasonable and feasible complexity. (You can always add more features and optimizations as you go.)

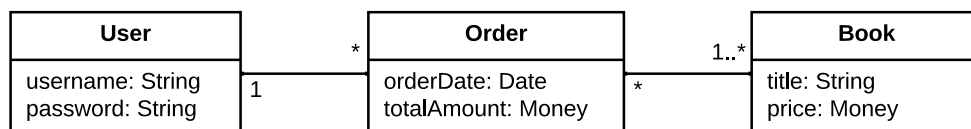

The customer journey needs to fulfill the following requirements:

- Customer journey is specific to the business idea.
- Frontend and backend are involved.
- CRUD operations involving the database are performed.
- Key elements of your business idea (e.g., role-based authentication, payment) should be included.

It is highly advised to talk to your advisor to determine whether your proposed customer journey fulfills the requirements.

The accompanying **mockups** should illustrate the key steps of the customer journey. For example, if you develop an online shopping platform for books, and your customer journey includes searching for books based on specific attributes (e.g., title), one of the mockups could sketch what the search UI of your web application looks like. If the mockups are not self-explanatory, please add short descriptions/explanations.

Furthermore, thoroughly think about the conceptual (logical) data model of your web application: Which are the basic data entities your web application has to deal with, and how are they related to each other? For this purpose, use a **UML class diagram** to design such a **conceptual (logical) data model**. For example, an excerpt of the data model of a book shopping platform might look as follows:

Note: Conceptual data models do not contain methods or visibility for attributes, just classes, attributes, and their relationships (incl. multiplicities).

Recommended Tools:

In general, you can use any tool(s) you like to create the mockups and the UML class diagram.

For the mockups you could use [Figma](#), [Balsamiq Wireframes](#), [Wireframe.cc](#), etc.

For the UML class diagram you could use [Apollon](#), [Gliffy](#), [Lucidchart](#), etc.

2. Presentation Session

Please make sure to arrive at the presentation room in time. Right before your presentation, make sure that your **presentation** is **loaded on your machine and ready to be presented**.

The presentation has to be composed of three parts:

1. Short recap of your business idea (~1min)
2. Detailed description of how your web application delivers value to the customers through an example customer journey using personas and mockups (~1min for personas and no explaining text for the mockups on the slides)
3. Overview of the conceptual data model of your web application (1 slide)

Do not show more than one mockup per slide and minimize the white space on your slides so that all text is easily readable.

The presentation must not exceed 10 minutes. The subsequent discussion will last an additional 10 minutes at most.

The presentation of the slides has to be done by exactly two students. These two presenters will be assigned randomly immediately before the presentation. Therefore, make sure that all team members are familiar with the business idea, the customer journey, the data model, and can deliver the presentation confidently. However, in the discussion session, each team member might be asked and take part in the discussion.

Please note that these presentations count as official examinations. Therefore, not being present during your presentation slot without a valid excuse (e.g., sickness - medical certificate necessary) will be treated like not appearing to an exam, i.e., the individual team member(s) will be graded with a 5.0 for this assignment.

3. Deliverables

For this assignment, there is **one deliverable** to submit:

1. A **paper** (in PDF format) containing a textual description of the **customer journey** including **personas**, **related mockups**, and a **UML class diagram** of the **conceptual (logical) data model** of your web application. This paper has to be structured as follows:
 - Exactly 10 pages for the **customer journey** including **personas** and **related mockups** (incl. short bullet point explanations for mockups)
 - 1 page containing the **UML class diagram** of your **conceptual (logical) data model**

4. Evaluation

The assignment is evaluated according to the following criteria:

- Clear and concise **description of the customer journey incl. personas**
- Quality of **mockups** as well as coherence to the customer journey
- Quality and **UML-conformity** of the **conceptual (logical) data model**
- Style and structure of the documents
- Quality of your presentation

The grade of this assignment counts 15% towards the overall final grade.

Submission deadline can be found [HERE](#).
